Reasons for Allowance

The following is an examiner's statement of reasons for allowance:

None of the prior art made of record teaches or suggests a computer-implemented method for processing a digital image, the method comprising:

modifying the digital image at a location within the image, the modification causing a change of a first local attribute of the image at the location;

measuring the change of the first attribute at the location; and

adjusting a second attribute of the image at the location based on the measured change of the first local attribute, the second attribute being different from the first attribute.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

-The closest prior art, Ahn (6,191,823) discloses (Fig. 1) an analog/digital color video apparatus for adjusting attributes of a color video signal including a first attribute adjuster (15) and a second attribute adjuster (25). Ahn further discloses (Fig. 2) a color image sharpness adjuster (81), a tint adjuster (83), and a color image

contrast/brightness adjuster (87). However, Ahn fails to disclose the steps of “measuring the change of the first attribute at the location; and adjusting a second attribute of the image at the location based on the measured change of the first local attribute, the second attribute being different from the first attribute.”

-Sawada et al (US 2003/0001856) discloses (Fig. 1 and 4) an image display apparatus (100) displays an image signal on a specific area of a display screen by modifying the display attribute of the specific area on the display screen in accordance with the area-attribute information received from the information processing apparatus.

-Ameline et al (US 2003/0131237) disclose (Fig. 2) a portion (T) of the image window (W2) can be updated by a watermark routine to watermark the portion of the image located in the portion (T). Ameline et al further disclose, for each output image, a digital watermark is generated having at least one attribute that is function of a variable associated with the attribute. Each variable is capable of modification from image to image to produce a digital watermark with different attributes on each output image. However, Ameline et al fail to “measure the change of the first attribute at the location”.
